$$e^{i\theta} = \cos(\theta) + i\sin(\theta)$$

 $e^{-i\theta} = \cos(\theta) - i\sin(\theta)$

$$\begin{aligned} \det\cot(\theta) &= x \\ x(i+ie^{2i\theta}) &= -1(1+e^{2i\theta}) \\ ix+ixe^{2i\theta} &= -e^{2i\theta}-1 \\ ixe^{2i\theta}+e^{2i\theta} &= -1-ix \\ (ix+1)e^{2i\theta} &= -1-ix \\ e^{2i\theta} &= -\frac{1-ix}{1+ix} \\ 2i\theta &= \ln(\frac{x+i}{x-i}) \\ i\theta &= \frac{1}{2}\ln(\frac{x+i}{x-i}) \\ \theta &= -\frac{i}{2}\ln(\frac{x+i}{x-i}) \end{aligned}$$

$$\therefore \operatorname{arccot}(\theta) = -\frac{i}{2} \ln(\frac{\theta+i}{\theta-i})$$
